1 Vector Space

1.1 Fundamental Properties

Definiton 1.1.1 (Vector Space in \mathbb{R} , Field). This course concerns with real vector spaces. A vectors space, V , over \mathbb{R} is a collection of **object** $\mathbf{v} \in V$ s.t. the follow axioms are followed

1. Addition Axioms

- (a) **Closure Under Addition:**
 $\mathbf{x}, \mathbf{y} \in V \implies \mathbf{x} + \mathbf{y} \in V$
- (b) **Associativity of Addition:**
 $\mathbf{x}, \mathbf{y}, \mathbf{z} \in V \implies (\mathbf{x} + \mathbf{y}) + \mathbf{z} = \mathbf{x} + (\mathbf{y} + \mathbf{z})$
- (c) **Existence of Additive Identity:**
 $\exists \mathbf{0} \in V$ such that $\mathbf{x} \in V \implies \mathbf{x} + \mathbf{0} = \mathbf{x}$
- (d) **Existence of Additive Inverse:**
 $\forall \mathbf{x} \in V, \exists -\mathbf{x} \in V$ such that $\mathbf{x} + -\mathbf{x} = \mathbf{0}$

2. Scalar Multiplication Axioms

- (a) **Closure Under Scalar Multiplication:**
 $\forall \mathbf{x} \in V$ and $\forall \alpha \in \mathbb{R}, \alpha \mathbf{x} \in V$
- (b) **Associativity of Scalar Multiplication:**
 $\forall \mathbf{x} \in V$ and $\forall \alpha, \beta \in \mathbb{R}, (\alpha\beta)\mathbf{x} = \alpha(\beta\mathbf{x})$
- (c) **Distributive Property of Scalar Multiplication:**
 $\forall \mathbf{x} \in V$ and $\forall \alpha, \beta \in \mathbb{R}, (\alpha + \beta)\mathbf{x} = \alpha\mathbf{x} + \beta\mathbf{x}$
- (d) **Existence of Multiplicative Identity:**
 $\forall \mathbf{x} \in V, 1\mathbf{x} = \mathbf{x}$

Note It could be shown that the axiom imply the commutativity of in addition, namely $\forall \mathbf{x}, \mathbf{y} \in \mathbb{R}, \mathbf{x} + \mathbf{y} = \mathbf{y} + \mathbf{x}$

Example \mathbb{R}^n is a vector space over \mathbb{R} , where $\mathbf{x} = (x_1, x_2, \dots, x_n)$ and $\mathbf{y} = (y_1, y_2, \dots, y_n)$, then $\mathbf{x} + \mathbf{y} = (x_1 + y_1, x_2 + y_2, \dots, x_n + y_n)$ and $\alpha \mathbf{x} = (\alpha x_1, \alpha x_2, \dots, \alpha x_n)$

Theorem 1.1.2 (Cancellation, Part 1). Let V be a vector space and $\mathbf{x}, \mathbf{y}, \mathbf{z} \in V$, then:

$$\begin{aligned}\mathbf{x} + \mathbf{z} &= \mathbf{y} + \mathbf{z} \\ \mathbf{x} &= \mathbf{y}\end{aligned}$$

Proof.

$$\mathbf{x} + \mathbf{z} = \mathbf{y} + \mathbf{z}$$

From additive inverse we know that $-\mathbf{z}$ exists

$$(\mathbf{x} + \mathbf{z}) + (-\mathbf{z}) = (\mathbf{y} + \mathbf{z}) + (-\mathbf{z})$$

By order of addition we have:

$$\begin{aligned}\mathbf{x} + (\mathbf{z} + (-\mathbf{z})) &= \mathbf{y} + (\mathbf{z} + (-\mathbf{z})) \\ \mathbf{x} + \mathbf{0} &= \mathbf{y} + \mathbf{0}\end{aligned}$$

By additive identity we have:

$$\mathbf{x} = \mathbf{y}$$

□

Theorem 1.1.3 (Cancellation, Part 2). Let V be a vector space and $\mathbf{x}, \mathbf{y}, \mathbf{z} \in V$, then:

$$\begin{aligned}\mathbf{z} + \mathbf{x} &= \mathbf{z} + \mathbf{y} \\ \mathbf{x} &= \mathbf{y}\end{aligned}$$

To prove that, it would require the following proposition:

Lemma 1.1.4. Let V be a vector space and $\mathbf{z} \in V$, then $-\mathbf{z} + \mathbf{z} = \mathbf{0}$

Proof.

We know:

$$\begin{aligned}-\mathbf{z} + \mathbf{z} &= (-\mathbf{z} + \mathbf{z}) + \mathbf{0} \\ &= (-\mathbf{z} + \mathbf{z}) + (-\mathbf{z} + -(-\mathbf{z}))\end{aligned}$$

By the order of addition,

$$= -\mathbf{z} + (\mathbf{z} + (-\mathbf{z} + -(-\mathbf{z})))$$

Again, by the order of addition,

$$\begin{aligned}&= -\mathbf{z} + ((\mathbf{z} + (-\mathbf{z})) + -(-\mathbf{z})) \\ &= -\mathbf{z} + -(-\mathbf{z}) \\ &= \mathbf{0}\end{aligned}$$

□

1.1 Fundamental Properties

Now, to prove the part 2 of the Cancellation Theorem:

Proof.

$$\mathbf{z} + \mathbf{x} = \mathbf{z} + \mathbf{y}$$

From additive inverse we know that $-\mathbf{z}$ exists

$$-\mathbf{z} + (\mathbf{z} + \mathbf{x}) = -\mathbf{z} + (\mathbf{z} + \mathbf{y})$$

$$(-\mathbf{z} + \mathbf{z}) + \mathbf{x} = (-\mathbf{z} + \mathbf{z}) + \mathbf{y}$$

From above, we have $-\mathbf{z} + \mathbf{z} = 0$

$$0 + \mathbf{x} = 0 + \mathbf{y}$$

$$\mathbf{x} = \mathbf{y}$$

□

Lemma 1.1.5 (Inverse of an inverse). Let V be a vector space and $\mathbf{x} \in V$, then:

$$-(-\mathbf{x}) = \mathbf{x}$$

Proof. Assume $0, 0^*$ are the additive identity of V and $-\mathbf{x}, -\mathbf{x}^*$ are the additive inverse of \mathbf{x} . We have:

$$u + 0 = u + 0^*$$

By Cancellation Theorem, we have $0 = 0^*$. Thus, the additive identity is unique. Now, we have:

$$\mathbf{x} + -\mathbf{x} = 0$$

$$\mathbf{x} + -\mathbf{x}^* = 0$$

Thus, by the uniqueness of the additive inverse, we have:

$$\mathbf{x} + -\mathbf{x} = \mathbf{x} + -\mathbf{x}^*$$

By the Cancellation Theorem, we have:

$$-\mathbf{x} = -\mathbf{x}^*$$

Now, we have that the additive inverse is unique. Thus, $-(-\mathbf{x})$ must be unique and necessarily \mathbf{x} . □

Additional Results from Above

1. The additive identity is unique
2. The additive inverse is unique

Definiton 1.1.6 (Subtraction). Let V be a vector space and $\mathbf{x}, \mathbf{y} \in V$, then:

$$\mathbf{x} - \mathbf{y} \stackrel{\text{def}}{=} \mathbf{x} + -\mathbf{y}$$

Theorem 1.1.7 (Addition is Commutative). Let V be a vector space and $\mathbf{x}, \mathbf{y} \in V$, then:

$$\mathbf{x} + \mathbf{y} = \mathbf{y} + \mathbf{x}$$

Proof.

$$\mathbf{x} + \mathbf{y} =$$

□

1.2 Vector Subspace

Definiton 1.2.1 (Vector Subspace). Let V be a vector space and $W \subseteq V$, then W is a vector subspace of V if W is a vector space.

Theorem 1.2.2 (Subspace Test, I). Let V be a vector space over \mathbb{R} and $W \subseteq V$ with the usual addition and scalar multiplication, then W is a subspace of V iff for all $\mathbf{x}, \mathbf{y} \in W$ and $\alpha \in \mathbb{R}$:

1. **Closure Under Addition:**

$$\mathbf{x} + \mathbf{y} \in W$$

2. **Closure Under Scalar Multiplication:**

$$\alpha \mathbf{x} \in W$$

3. **Additive Identity:**

$$\mathbf{0} \in W$$

Proof. (\Rightarrow) Assume W is a subspace of V , then W is a vector space. Thus, the axioms of vector space are satisfied.

(\Leftarrow) Assume the three conditions are satisfied, then W is a vector space. Thus, W is a subspace of V . □

Definiton 1.2.3 (Null Space). Let V be a vector space and $A \in {}^m\mathbb{R}^{n1}$, then:

$$\text{null}(A) = \{\mathbf{x} \in {}^n\mathbb{R} \mid A\mathbf{x} = \mathbf{0}\} \quad (1)$$

is the null space of A , otherwise known as the **kernel** of A or the solution space of $A\mathbf{x} = \mathbf{0}$

We can use the Subspace Test I to show that the null space of a matrix is a subspace of ${}^n\mathbb{R}$.

1. **Existence of Additive Identity:**

The zero vector is in the null space of A as the trivial solution to the equation $A\mathbf{x} = \mathbf{0}$

2. **Closure Under Addition:**

Let $\mathbf{x}, \mathbf{y} \in \text{null}(A)$, then $A(\mathbf{x} + \mathbf{y}) = A\mathbf{x} + A\mathbf{y} = \mathbf{0} + \mathbf{0} = \mathbf{0}$. Thus, $\mathbf{x} + \mathbf{y} \in \text{null}(A)$. This holds since ${}^n\mathbb{R}$ is a vector space.

¹Same as $\mathbb{R}^{m \times n}$, The set of all $m \times n$ matrices with real entries

3. Closure Under Scalar Multiplication:

Let $\mathbf{x} \in \text{null}(A)$ and $\alpha \in \mathbb{R}$, then $A(\alpha\mathbf{x}) = \alpha A\mathbf{x} = \alpha\mathbf{0} = \mathbf{0}$. Thus, $\alpha\mathbf{x} \in \text{null}(A)$. This holds since ${}^n\mathbb{R}^m$ is a vector space under usual addition and scalar multiplication.

Theorem 1.2.4 (Subspace Test, II). Let V be a vector space over \mathbb{R} and $W \subseteq V$ with the usual addition and scalar multiplication, then W is a subspace of V iff for all $\mathbf{x}, \mathbf{y} \in W$ and $\alpha, \beta \in \mathbb{R}$:

1. $\alpha\mathbf{x} + \beta\mathbf{y} \in W$

Proof. (\Rightarrow) Assume W is a subspace of V , then W is a vector space. Thus, the axioms of vector space are satisfied.

(\Leftarrow) Assume the condition is satisfied, then W is a vector space. Thus, W is a subspace of V . \square

Definiton 1.2.5 (Intersection of Sets). Let A and B be sets, then:

$$A \cap B = \{x \mid x \in A \text{ and } x \in B\} \quad (2)$$

Definiton 1.2.6 (Union of Sets). Let A and B be sets, then:

$$A \cup B = \{x \mid x \in A \text{ or } x \in B\} \quad (3)$$

2 Linear combinations and Bases

Definiton 2.0.1 (Linear Combination). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$ and $\alpha_1, \alpha_2, \dots, \alpha_n \in \mathbb{R}$, then:

$$\alpha_1\mathbf{v}_1 + \alpha_2\mathbf{v}_2 + \dots + \alpha_n\mathbf{v}_n$$

is a linear combination of $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$

2.1 Linear Independence, Span, and Basis

Definiton 2.1.1 (Linear independence). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$ and $\alpha_1, \alpha_2, \dots, \alpha_n \in \mathbb{R}$. If and only if the equation:

$$\alpha_1\mathbf{v}_1 + \alpha_2\mathbf{v}_2 + \dots + \alpha_n\mathbf{v}_n = \mathbf{0}$$

has **only** the trivial solution $\alpha_1 = \alpha_2 = \dots = \alpha_n = 0$.

Then, $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are said to be linearly independent; otherwise, they are linearly dependent.

Definiton 2.1.2 (Span). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$, then:

$$\text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n) = \{\alpha_1\mathbf{v}_1 + \alpha_2\mathbf{v}_2 + \dots + \alpha_n\mathbf{v}_n \mid \alpha_1, \alpha_2, \dots, \alpha_n \in \mathbb{R}\} \quad (4)$$

is the set of all linear combinations of $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$

2.2 Fundamental Theorem of Linear Algebra

Theorem 2.1.3 (Unique Representation). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$ and $\alpha_1, \alpha_2, \dots, \alpha_n \in \mathbb{R}/0$, and that they span V . For any $\mathbf{v}_{n+1} \in V$, if $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly independent, then the equation:

$$\alpha_1 \mathbf{v}_1 + \alpha_2 \mathbf{v}_2 + \dots + \alpha_n \mathbf{v}_n = \mathbf{v}_{n+1}$$

is the only way to express \mathbf{v}_{n+1} as a linear combination of $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$.

We can prove by contrapositive:

Proof. Assume that there exists another way to express \mathbf{v}_{n+1} as a linear combination of $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$, then:

$$\alpha_1 \mathbf{v}_1 + \alpha_2 \mathbf{v}_2 + \dots + \alpha_n \mathbf{v}_n = \beta_1 \mathbf{v}_1 + \beta_2 \mathbf{v}_2 + \dots + \beta_n \mathbf{v}_n$$

Rearranging the equation, we have:

$$(\alpha_1 - \beta_1) \mathbf{v}_1 + (\alpha_2 - \beta_2) \mathbf{v}_2 + \dots + (\alpha_n - \beta_n) \mathbf{v}_n = \mathbf{0}$$

Since $(\alpha_i - \beta_i)$ for $i = 1, 2, \dots, n$ are not all zero, then $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly dependent. Thus, the contrapositive is true. \square

Theorem 2.1.4 (Growing and Pruning). The following are the two theorems describe the relationship between linear independence and the span:

Growing Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$ be linearly independent. If $\mathbf{v}_{n+1} \in V$ and $\mathbf{v}_{n+1} \notin \text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n)$, then $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n, \mathbf{v}_{n+1}$ are linearly independent.

Pruning Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$. If $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly dependent, then there exists a \mathbf{v}_i such that $\mathbf{v}_i \in \text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_{i-1}, \mathbf{v}_{i+1}, \dots, \mathbf{v}_n)$.

Theorem 2.1.5 (Span and Linear Independence). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$. For every \mathbf{v}_k with $k = 1, 2, \dots, n$, $\text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_{k-1}, \mathbf{v}_{k+1}, \dots, \mathbf{v}_n) \subset \text{Span}(\mathbf{v}_1, \dots, \mathbf{v}_n)$ if and only if $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly independent.

Definiton 2.1.6 (Basis). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$. If $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly independent and $\text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n) = V$, then $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ is a basis of V .

2.2 Fundamental Theorem of Linear Algebra

Theorem 2.2.1 (Fundamental Theorem of Linear Algebra). Let V be a vector space and $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n \in V$. If $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$ are linearly independent and $\text{Span}(\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n) = V$, then:

1. Any basis of V has the same number of elements.
2. Any linearly independent set of V has at most n elements.
3. Any spanning set of V has at least n elements.

2.2 Fundamental Theorem of Linear Algebra

Example 2.2.2 (Dimension of Even 4-degree polynomial). Given $W \subseteq \mathbb{P}_4$ where $W = \{p(x) \mid p(x) = p(-x)\}$, then W is a subspace of \mathbb{P}_4 . Since $x^3, x \in P_4$ but $x^3, x \notin W$, $\text{Span}(\{W, x, x^3\}) = \dim(W) + 2$. So $\dim(W) \leq 3$; We can find 3 linearly independent vectors in W such as $1, x^2, x^4$. Thus, $\dim(W) \geq 3$. Thus, $\dim(W) = 3$.

Definiton 2.2.3 (Column Space). Let $a_1, a_2, \dots, a_n \in {}^m\mathbb{R}$, then:

$$\text{Col}(A) = \text{Span}(a_1, a_2, \dots, a_n) \quad (5)$$

is the column space of A .

Definiton 2.2.4 (Row Space). Let $a_1, a_2, \dots, a_n \in {}^m\mathbb{R}$, then:

$$\text{Row}(A) = \text{Span}(a_1, a_2, \dots, a_n) \quad (6)$$

is the row space of A .

Note that the span of set is a subspace of the vector space. Thus, the column space of a matrix is a subspace of ${}^m\mathbb{R}$. This is also call the set of images of the transformation. We can also note that matrix multiplication is commutative with scalar multiplication. We can conduct proofs using such properties.

Definiton 2.2.5 (Rank). Let $A \in {}^m\mathbb{R}^n$, then:

$$\text{rank}(A) = \dim(\text{Col}(A)) \quad (7)$$

is the rank of A .

Theorem 2.2.6 (Rank of RREF). Let $A \in {}^m\mathbb{R}^n$, then:

$$\text{rank}(A) = \text{rank}(\text{RREF}(A)) \quad (8)$$

Theorem 2.2.7 (Dimension of Row and Column Space). Let $A \in {}^m\mathbb{R}^n$, then:

$$\dim(\text{Row}(A)) = \text{rank}(A) \quad (9)$$

$$\dim(\text{Col}(A)) = \text{rank}(A) \quad (10)$$

Definiton 2.2.8 (Matrix Multiplication). Let $A \in {}^m\mathbb{R}^n$ and $B \in {}^n\mathbb{R}^p$, then:

$$(AB)_{ij} = \sum_{k=1}^n a_{ik}b_{kj} \quad (11)$$

Definiton 2.2.9 (Column View of Matrix Multiplication). Let $A \in {}^m\mathbb{R}^n$ and $B \in {}^n\mathbb{R}^p$, then:

$$AB = [Ab_1 \quad Ab_2 \quad \dots \quad Ab_p] \quad (12)$$

Theorem 2.2.10 (Column Space of Matrix Multiplication). Let $A \in {}^m\mathbb{R}^n$ and $B \in {}^n\mathbb{R}^p$, then:

$$\text{Col}(AB) \subseteq \text{Col}(A) \quad (13)$$

If B is a invertible matrix, then also $\text{Col}(A) \subseteq \text{Col}(AB)$

Definiton 2.2.11 (Invertible). Let $A \in {}^n\mathbb{R}^n$, then A is invertible if there exists a matrix $B \in {}^n\mathbb{R}^n$ such that:

$$AB = BA = I \quad (14)$$

where I is the identity matrix, and we denote $B = A^{-1}$, the inverse of A .

Proof. Let A, B be matrices, so $\text{col}(AB) = \text{Span}(\text{columns of } AB)$. In the column view, we have $AB = A(\text{columns of } B) = [Ab_1 \ Ab_2 \ \dots \ Ab_p]$ Each column of AB is in $\text{Col}(A)$. So each column of AB is a linear combination of the columns of A . Thus, $\text{Col}(AB) \subseteq \text{Col}(A)$.

Consider the case where B is invertible. Let $C = AB$, Then $CB^{-1} = A$. Since it is proven that $\text{col}(CB^{-1}) \subseteq \text{col}(C)$, hence, $\text{col}(A) \subseteq \text{col}(AB)$. \square

Definiton 2.2.12 (Null Space of Matrix Multiplication). Let $A \in {}^m\mathbb{R}^n$ and $B \in {}^n\mathbb{R}^p$, then:

$$\text{null}(AB) \supseteq \text{null}(B) \quad (15)$$

Definiton 2.2.13 (Rank-Nullity Theorem). Let $A \in \mathbb{R}^{m \times n}$. Then:

$$\dim(\text{null}(A)) = n - \text{rank}(A) \quad (16)$$

where n is the number of columns of A .

Proof. Consider $A \in {}^m\mathbb{R}^n$, Let $S = \{x_1, x_2, \dots, x_k\}$ be a basis of $\text{null}(A)$, then $\{x_1, x_2, \dots, x_k\}$ are linearly independent and that $\dim(\text{null}(A)) = k$. We can extend S to a basis of ${}^n\mathbb{R}$ by adding $n - k$ vectors, $\{x_{k+1}, x_{k+2}, \dots, x_n\}$, then $\{x_1, x_2, \dots, x_n\}$ is a basis of ${}^n\mathbb{R}$. Since $\{x_1, x_2, \dots, x_n\}$ is a basis of ${}^n\mathbb{R}$, then $\text{rank}(A) = n - k$. Assert that $n - k \geq 0$. If we can show that $\{Ax_1, Ax_2, \dots, Ax_n\}$ is a basis of $\text{Col}(A)$, then we can show that $\text{rank}(A) = n - k$. We can show that $\{Ax_1, Ax_2, \dots, Ax_n\}$ is a basis of $\text{Col}(A)$ by showing that $\{Ax_1, Ax_2, \dots, Ax_n\}$ is linearly independent and that $\text{Span}(\{Ax_1, Ax_2, \dots, Ax_n\}) = \text{Col}(A)$. \square

Theorem 2.2.14 (Properties of Row and Column Space w.r.t RREF). Let $A \in {}^m\mathbb{R}^n$ and $\tilde{A} = \text{RREF}(A)$, then:

$$\dim(\text{Row}(\tilde{A})) = \dim(\text{Row}(A)) \quad (17)$$

$$\dim(\text{Col}(\tilde{A})) = \dim(\text{Col}(A)) \quad (18)$$

$$\text{Row}(\tilde{A}) = \text{Row}(A) \quad (19)$$

$$\text{Col}(\tilde{A}) \neq \text{Col}(A) \quad (20)$$

3 Linear Transformations

Definiton 3.0.1 (Linear Transformation). Let V and W be vector spaces, then $T : V \rightarrow W$ is a linear transformation if:

1. $T(\mathbf{x} + \mathbf{y}) = T(\mathbf{x}) + T(\mathbf{y})$

2. $T(\alpha\mathbf{x}) = \alpha T(\mathbf{x})$

Example 3.0.2 ($Ax + b$ is not LT). Let $A \in {}^m\mathbb{R}^n$ and $b \in \mathbb{R}^m$, then $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ defined by $T(\mathbf{x}) = A\mathbf{x} + b$ is not a linear transformation. It violates the first property of linear transformation:

$$\begin{aligned} T(\mathbf{x} + \mathbf{y}) &= A(\mathbf{x} + \mathbf{y}) + b \\ &= A\mathbf{x} + A\mathbf{y} + b \\ &= T(\mathbf{x}) + T(\mathbf{y}) + b \end{aligned}$$

Example 3.0.3 (Rotate by 90°). Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ defined by $T(\mathbf{x}) = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \mathbf{x}$, then T is a linear transformation. It satisfies the properties of linear transformation.

$$\begin{aligned} T(\mathbf{x} + \mathbf{y}) &= \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} (\mathbf{x} + \mathbf{y}) \\ &= \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \mathbf{x} + \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \mathbf{y} \\ &= T(\mathbf{x}) + T(\mathbf{y}) \end{aligned}$$

$$\begin{aligned} T(\alpha\mathbf{x}) &= \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} (\alpha\mathbf{x}) \\ &= \alpha \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \mathbf{x} \\ &= \alpha T(\mathbf{x}) \end{aligned}$$

Theorem 3.0.4 (Properties of Linear Transformation). Let $T : V \rightarrow W$ be a linear transformation, then:

1. $T(\mathbf{0}) = \mathbf{0}$

2. $T(\mathbf{x} - \mathbf{y}) = T(\mathbf{x}) - T(\mathbf{y})$

Proof. We have $T(\mathbf{0} + X) = T(X) = T(\mathbf{0}) + T(X)$. Thus, $T(\mathbf{0}) = \mathbf{0}$, by the Cancellation Theorem. We also have $T(\mathbf{x} - \mathbf{y}) = T(\mathbf{x} + (-\mathbf{y})) = T(\mathbf{x}) + T(-\mathbf{y}) = T(\mathbf{x}) - T(\mathbf{y})$. \square

Definiton 3.0.5 (Kernel and Image). Let $T : V \rightarrow W$ be a linear transformation, then:

1. The **kernel** of T , denoted as $\ker(T)$, is the set of all vectors in V that map to the zero vector in W . Formally,

$$\ker(T) = \{\mathbf{v} \in V \mid T(\mathbf{v}) = \mathbf{0}\}$$

2. The **image** of T , denoted as $\text{Im}(T)$, is the set of all vectors in W that are images of vectors in V . Formally,

$$\text{Im}(T) = \{T(\mathbf{v}) \mid \mathbf{v} \in V\}$$

3.1 Change of Basis

Theorem 3.0.6 (Rank-Nullity for LT). Let $T : V \rightarrow W$ be a linear transformation, then:

$$\dim(\ker(T)) + \dim(\text{Im}(T)) = \dim(V) \quad (21)$$

Definiton 3.0.7 (Injective LT). Let $T : V \rightarrow W$ be a linear transformation, then T is injective if $x_1 \neq x_2 \implies T(x_1) \neq T(x_2)$

Theorem 3.0.8. If the nullity of T , $\dim \ker T$ is greater than zero, then T is not injective.

Definiton 3.0.9 (Surjective). Let $T : V \rightarrow W$ be a linear transformation, then T is surjective if for every $y \in W$, there exist an $x \in V$ so that $T(x) = y$.

Definiton 3.0.10 (Bijective). Let $T : V \rightarrow W$ be a linear transformation, then T is bijective if T is both injective and surjective.

Theorem 3.0.11 (Basis function is LT). Let $\alpha = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ be a basis for vector space V . The function $T : V \rightarrow \mathbb{R}^n$ defined by $T(v) = [v]_\alpha$ is a linear transformation.

3.1 Change of Basis

Definiton 3.1.1 (Change of Basis). Let $\alpha = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ and $\beta = \{\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_n\}$ be two bases for vector space V . The change of basis matrix P is defined as:

$$P = [\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_n]_\alpha \quad (22)$$

Theorem 3.1.2 (Change of Basis Matrix). Let $\alpha = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ and $\beta = \{\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_n\}$ be two bases for vector space V . The change of basis matrix P is defined as:

$$P = [\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_n]_\alpha \quad (23)$$

Stacking Chnage of Basis Matrix We can stack the change of basis matrix to form a matrix P , and also incorporate linear transformations in other bases to a vector.

4 Determinants and Inverses

4.1 Determinants

Definiton 4.1.1 (Determinant). Let $A \in \mathbb{R}^{n \times n}$, then the determinant of A is denoted as $\det(A)$.

Example 4.1.2. Consider the following 2×2 system:

$$\begin{aligned} ax + by &= 0 \\ cx + dy &= 0 \end{aligned}$$

4.2 Constructing Determinants and Inverses

The the system has the general solution:

$$x = \frac{dy}{ad - bc}$$

$$y = \frac{-cx}{ad - bc}$$

The denominator $ad - bc$ is the determinant of the matrix. Notice that if the determinant is zero, then the system has no unique solution.

Theorem 4.1.3 (Properties of 2×2 Determinant). Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then:

$$\det(A) = ad - bc \quad (24)$$

$$\det \left(\begin{bmatrix} br_1 + cr'_1 \\ r_2 \end{bmatrix} \right) = b \det \left(\begin{bmatrix} r_1 \\ r_2 \end{bmatrix} \right) + c \det \left(\begin{bmatrix} r'_1 \\ r_2 \end{bmatrix} \right) \quad (25)$$

$$\det \left(\begin{bmatrix} r_1 \\ r_2 \end{bmatrix} \right) = -\det \left(\begin{bmatrix} r_2 \\ r_1 \end{bmatrix} \right) \quad (26)$$

$$\det I = 1 \quad (27)$$

Definiton 4.1.4 (Determinant Functions). Any function f that satisfies the properties:

$$1. \ f \left(\begin{bmatrix} br_1 + cr'_1 \\ r_2 \\ \vdots \\ r_n \end{bmatrix} \right) = bf \left(\begin{bmatrix} r_1 \\ r_2 \\ \vdots \\ r_n \end{bmatrix} \right) + cf \left(\begin{bmatrix} r'_1 \\ r_2 \\ \vdots \\ r_n \end{bmatrix} \right) \quad (\text{Multilinearity in rows})$$

$$2. \ f \left(\begin{bmatrix} r_1 \\ r_2 \\ \vdots \\ r_i \\ \vdots \\ r_j \\ \vdots \\ r_n \end{bmatrix} \right) = -f \left(\begin{bmatrix} r_1 \\ r_2 \\ \vdots \\ r_j \\ \vdots \\ r_i \\ \vdots \\ r_n \end{bmatrix} \right) \quad (\text{Alternating property})$$

$$3. \ f(A) = (\det A)f(I)$$

is called a determinant function.

Theorem 4.1.5. If f is alternating on rows and A is a matrix that has two identical rows, then $f(A) = 0$.

4.2 Constructing Determinants and Inverses

Definiton 4.2.1 (Minor Matrix). Let $A \in \mathbb{R}^{n \times n}$, then the minor of A is denoted as A_{ij} , which the matrix obtained by removing the i -th row and j -th column of A .

Example 4.2.2. Let $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$, then the minor of A is:

$$A_{11} = \begin{bmatrix} 5 & 6 \\ 8 & 9 \end{bmatrix} \quad A_{12} = \begin{bmatrix} 4 & 6 \\ 7 & 9 \end{bmatrix} \quad A_{13} = \begin{bmatrix} 4 & 5 \\ 7 & 8 \end{bmatrix}$$

Find the Determinant from a Row We can find the determinant of a matrix by expanding along a row. We can expand along any row or column, but it is easier to expand along a row with zeros.

Definiton 4.2.3 (Cofactor). Let $A \in \mathbb{R}^{n \times n}$, then the cofactor of A is denoted as C_{ij} , which is defined as:

$$C_{ij} = (-1)^{i+j} \det(A_{ij}) \quad (28)$$

Checkerboard Pattern We can use the checkerboard pattern to find the determinant of a matrix. We can expand along any row or column, but it is easier to expand along a row with zeros.

Definiton 4.2.4 (Determinant). Let $A \in \mathbb{R}^{n \times n}$, then the determinant of A is denoted as $\det(A)$, which is defined as:

$$\det(A) = \sum_{j=1}^n a_{ij} C_{ij} \quad (29)$$

Example 4.2.5. Let $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$, then the cofactor of A is:

$$C_{11} = \begin{bmatrix} 5 & 6 \\ 8 & 9 \end{bmatrix} \quad C_{12} = \begin{bmatrix} 4 & 6 \\ 7 & 9 \end{bmatrix} \quad C_{13} = \begin{bmatrix} 4 & 5 \\ 7 & 8 \end{bmatrix}$$

Find the Determinant from a Column We can find the determinant of a matrix by expanding along a column. We can expand along any row or column, but it is easier to expand along a column with zeros.

Using Elementary Row Operations We can use elementary row operations to simplify the matrix on the row or column we are expanding along (by having zeros).

Theorem 4.2.6 (Determinant w.r.t Elementary Row Operations). Consider the following elementary row operations:

1. **Swapping two rows:** The determinant of the matrix changes sign due to the alternating property.
2. **Multiplying a row by a scalar:** The determinant of the matrix is multiplied by the scalar. This is obvious.

3. **Adding a multiple of one row to another row:** The determinant of the matrix remains the same. This is due to the multilinearity property.

Theorem 4.2.7 (Determinant of a Transpose). Let $A \in \mathbb{R}^{n \times n}$, then:

$$\det(A) = \det(A^T) \quad (30)$$

Example 4.2.8 (Determinant of a 5×5 Matrix). Let $A = \begin{bmatrix} 3 & 2 & 1 & 4 & -1 \\ 5 & 4 & 3 & 2 & 1 \\ 2 & 1 & 2 & 3 & 1 \\ -3 & 4 & 1 & 6 & 7 \\ 1 & 2 & 3 & 4 & 5 \end{bmatrix}$. We have:

Step 1: Swap row 1 and row 5

$$\det A = - \begin{vmatrix} 1 & 2 & 3 & 4 & 5 \\ 5 & 4 & 3 & 2 & 1 \\ 2 & 1 & 2 & 3 & 1 \\ -3 & 4 & 1 & 6 & 7 \\ 3 & 2 & 1 & 4 & -1 \end{vmatrix}$$

Step 2: Get row 2 - 5 start with 0

$$\det A = - \begin{vmatrix} 1 & 2 & 3 & 4 & 5 \\ 0 & -6 & -12 & -18 & -24 \\ 0 & -3 & -4 & -5 & -9 \\ 0 & 10 & 10 & 18 & 22 \\ 0 & -4 & -8 & -8 & -16 \end{vmatrix}$$

Step 3: Get it to a UTM

$$\det A = - \begin{vmatrix} 1 & 2 & 3 & 4 & 5 \\ 0 & -6 & -12 & -18 & -24 \\ 0 & 0 & 2 & 4 & 3 \\ 0 & 0 & 0 & 4 & 0 \\ 0 & 0 & 0 & 0 & -3 \end{vmatrix}$$

We can see that each row expansion is just a multiple of the minor below it. Thus, the determinant is the product of the diagonal elements.

$$\det A = -1 \times -6 \times 2 \times 4 \times -3 = -144$$

Theorem 4.2.9 (The theorem of Determinants and Inverse). Let $A \in \mathbb{R}^{n \times n}$, then the following properties hold:

1. A is invertible.
2. $\det(A) \neq 0$.
3. $\text{RREF}(A) = I$.
4. A is a product of elementary matrices.
5. $\det(A^{-1}) = \frac{1}{\det(A)}$.
6. $\text{rank}(A) = n$.

5 Eigen and Diagonalization

5.1 Eigenvalues and Eigenvectors

Definiton 5.1.1 (Eigenvalues and Eigenvectors). Let $A \in {}^n\mathbb{R}^n$, then λ is an eigenvalue of A if there exists a **non-zero** vector \mathbf{v} such that:

$$A\mathbf{v} = \lambda\mathbf{v} \quad (31)$$

The vector \mathbf{v} is called an eigenvector of A .

Theorem 5.1.2 (Properties of Eigenvalues and Eigenvectors). Let $A \in {}^n\mathbb{R}^n$, then the following properties hold:

1. The eigenvalues of A are the roots of the characteristic equation:

$$\det(A - \lambda I) = 0 \quad (32)$$

2. The eigenvectors of A are the solutions to the system of equations:

$$(A - \lambda I)\mathbf{v} = \mathbf{0} \quad (33)$$

Note If $A\mathbf{v} = \mathbf{0}$, then \mathbf{v} is an eigenvector of A with eigenvalue $\lambda = 0$.

Example 5.1.3 (Eigenvalues and Eigenvectors). Let $A = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$, then the characteristic equation is:

$$\begin{aligned} \det(A - \lambda I) &= \begin{vmatrix} 1 - \lambda & 2 \\ 2 & 1 - \lambda \end{vmatrix} \\ &= (1 - \lambda)(1 - \lambda) - 4 \\ &= \lambda^2 - 2\lambda - 3 = 0 \end{aligned}$$

The roots of the characteristic equation are $\lambda = 3, -1$. The eigenvectors are:

$$\begin{aligned} \text{For } \lambda = 3 : \begin{bmatrix} -2 & 2 \\ 2 & -2 \end{bmatrix} \mathbf{v} = \mathbf{0} &\implies \mathbf{v} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \\ \text{For } \lambda = -1 : \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix} \mathbf{v} = \mathbf{0} &\implies \mathbf{v} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \end{aligned}$$

Example 5.1.4. Let $A \in {}^n\mathbb{R}^n$ and has eigen value 2 with multiplicity 2, and eigen value 3 with multiplicity 1. Let x, y, z be eigenvectors of A corresponding to the eigenvalues 2, 2, 3 respectively. Then:

1. **$2\mathbf{x}$ is an eigenvector of \mathbf{A} :** Since $A(2x) = 2Ax = 2(2x)$, then $2x$ is an eigenvector of A with eigenvalue 2.
2. **$\mathbf{x} + \mathbf{y}$ is an eigenvector of \mathbf{A} :** Since $A(x + y) = Ax + Ay = 2x + 2y = 2(x + y)$, then $x + y$ is an eigenvector of A with eigenvalue 2.
3. **$\mathbf{x} + \mathbf{z}$ is an not an eigenvector of \mathbf{A} :** Since $A(x + z) = Ax + Az = 2x + 3z \neq \lambda(x + z)$, then $x + z$ is not an eigenvector of A .

5.2 Eigenspace and Multiplicity

Definiton 5.2.1 (Eigenspace). Let $A \in {}^n\mathbb{R}^n$, then the eigenspace of A corresponding to the eigenvalue λ is denoted as E_λ , which is defined as:

$$E_\lambda = \{\mathbf{v} \in \mathbb{R}^n \mid A\mathbf{v} = \lambda\mathbf{v}\} \quad (34)$$

, which is the union of all eigenvectors of A corresponding to the eigenvalue λ and $\mathbf{0}$.

Theorem 5.2.2 (Eigenspace is a Subspace). Let $A \in {}^n\mathbb{R}^n$, then the eigenspace of A corresponding to the eigenvalue λ is a subspace of \mathbb{R}^n with dimension equal to the multiplicity of λ (≥ 1).

Proof. This is obvious as eigenspace is a span of eigenvectors, and the span of eigenvectors is a subspace. To proof it, we use the subspace test:

1. **Non-emptiness:** Since $\mathbf{0}$ satisfies $A\mathbf{0} = \lambda\mathbf{0}$, then $\mathbf{0} \in E_\lambda$.
2. **Closure under addition:** Let $\mathbf{v}_1, \mathbf{v}_2 \in E_\lambda$, then $A(\mathbf{v}_1 + \mathbf{v}_2) = A\mathbf{v}_1 + A\mathbf{v}_2 = \lambda\mathbf{v}_1 + \lambda\mathbf{v}_2 = \lambda(\mathbf{v}_1 + \mathbf{v}_2)$, then $\mathbf{v}_1 + \mathbf{v}_2 \in E_\lambda$.
3. **Closure under scalar multiplication:** Let $\mathbf{v} \in E_\lambda$, then $A(c\mathbf{v}) = cA\mathbf{v} = c\lambda\mathbf{v} = \lambda(c\mathbf{v})$, then $c\mathbf{v} \in E_\lambda$.

□

Theorem 5.2.3 (Intersection of Eigenspaces). Let $A \in {}^n\mathbb{R}^n$, then the intersection of eigenspaces of A corresponding to distinct eigenvalues is $\{\mathbf{0}\}$, that is, for eigenvalues λ_1, λ_2 , if $\lambda_1 \neq \lambda_2$, then $E_{\lambda_1} \cap E_{\lambda_2} = \{\mathbf{0}\}$.

Definiton 5.2.4 (Algebraic Multiplicity (AM)). Let $A \in {}^n\mathbb{R}^n$, then the algebraic multiplicity of an eigenvalue λ is the number of times λ appears as a root of the characteristic equation.

Definiton 5.2.5 (Geometric Multiplicity (GM)). Let $A \in {}^n\mathbb{R}^n$, then the geometric multiplicity of an eigenvalue λ is the dimension of the eigenspace of λ .

Theorem 5.2.6 (Multiplicity of Eigenvalues). Let $A \in {}^n\mathbb{R}^n$, then the algebraic multiplicity of an eigenvalue is greater than or equal to the geometric multiplicity of the eigenvalue, that is:

$$\text{AM}(\lambda) \geq \text{GM}(\lambda) \geq 1 \quad (35)$$

Theorem 5.2.7 (Product of Eigenvalues). Let $A \in \mathbb{R}^{n \times n}$, then the product of the eigenvalues of A is equal to the determinant of A :

$$\prod_{i=1}^n \lambda_i = \det(A) \quad (36)$$
